Acknowledgement

I would like to express my gratitude to my supervisor Mr. Arun Kc, my reader Mr. Biraj Dulal for helping me and providing the best guidance and constructive criticism to complete my project.

I gained a lot of experience working on a full stack project throughout this project, which was my first opportunity to do so. The system's workflow and the many new words and jargon are among the most important things I learned. In addition, I gained knowledge of a variety of ideas and their relevance, which helped me finish my job quickly. These abilities have been really helpful to me, and I'm excited to use them in more projects in the future.

I admire all of your support and assistance.

Sincerely Yours,

Anirudha Dhungana

Abstract

An innovative project called TravelMate has the potential to entirely change the digital travel platform market. Adopting Scrum's agile methodology, TravelMate guarantees flexibility and responsiveness to travelers' constantly changing needs. By means of the deliberate application of a MERN stack, which consists of React.js, Express.js, Node.js, and MongoDB, TravelMate creates a strong basis for providing a platform that is scalable, effective, and user-focused. TravelMate demonstrates a thorough awareness of user requirements and a commitment to provide a flawless travel experience, with a keen focus on user authentication, package booking, user management, and auxiliary features like weather updates and currency conversion.

TravelMate is a vision of travel technology in the future where customer joy, innovation, and reliability come together to redefine the traveller's experience. Through its emphasis on teamwork, creativity, and ongoing enhancement, TravelMate establishes new benchmarks for quality in the digital travel industry, guaranteeing users an unmatched experience from planning to booking and beyond. TravelMate promises to be a game-changer in the travel industry, conveying an era of ease, reliability, and engaging experiences for tourists everywhere.

1. Introduction

Every person on earth earn to enjoy. According to the United Nations World Tourism Organization (UNWTO), over 1.4 billion people had travelled in 2019 which means every fifth person in the world had travelled. As of 2019, the travel industry's global GDP was over \$13,000 trillion. This is the data of people who travelled internationally. By adding the data of domestic tourists the GDP size would be much bigger. Various countries in the world like Maldives have been handling their major part of the economy through travel and tourism. (Mize, 2021)

In the context of Nepal, Nepal had organized the campaign called Visit Nepal 2020 where more than one lakh forty thousand international tourists had arrived despite the global pandemic COVID-19. The number of international tourists dropped by 80% and was lowest in 34 years. In the near future such a campaign would be a great success and to get the advantage from this the best travel booking and management system is needed which would help the industry to scale better and the referral from them the industry would be much bigger. (NepaliSansar, 2021)

Additionally, to get dipped in the travel industry the travel booking system should be introduced and integrated. The booking system should include a number of features to improve the overall travel experience and accelerate the booking process, are crucial tools for both individual and corporate travelers. These systems should come with easy-to-use interfaces for finding and purchasing travel services, safe online payment processing, real-time availability and pricing data, tools for managing travel itineraries, customer care, and others. (TravelPerk, 2023)

1.1. Project Briefing

TravelMate is a web application created to revolutionize the process of planning and booking travel. The name "TravelMate" captures its core mission: to be a reliable travel partner that strives to make every trip enjoyable and safe. By combining multiple services into a single platform, TravelMate alleviates the general annoyance of needing to navigate between numerous applications for different travel needs. Customers can book travel packages, customize the package, and get travel updates all from the comfort of their fingertips. TravelMate provides a full range of products and services that expedite the entire travel experience, catering to both individual travellers and travel agencies.

TravelMate's motto, "Explore the world with ease," highlights its dedication to offering a user-friendly and straightforward platform. This innovative approach allows customers to focus on the excitement of traveling rather than the difficulties of preparation. The application is carefully designed to improve user experience and reduce stress during travels. Key features include user support, weather updates, currency conversion, and travel-related news, all with a focus on user satisfaction. Additionally, the platform equips travel agents with the tools they need to offer their services efficiently. Through constant innovation and a commitment to providing top-notch services, TravelMate aims to become the best travel friend for adventurers.

The application personalizes the user experience to meet each individual's needs and preferences, emphasizing efficiency and creativity. By optimizing the trip preparation process, TravelMate gives consumers the confidence and ease to start their journeys. The platform boasts numerous features such as customizable travel packages, real-time updates, payment, and user friendly interface that makes booking and managing travel arrangements simple. TravelMate is designed to be the primary choice for travellers seeking a seamless and enjoyable planning experience.

End User: This system is intended to be made for the people of age group above 18 years as we need to upload the document for booking of the package. Mainly, this application is made for the people mainly between ages 20 to 60. This system also implies for travel agents and travel service providers.

1.2. Problem Statement

There are many platforms available for booking flights, hotels, car rentals, and other services, but the travel business is disjointed, making the planning process confusing and unpleasant. To get various services we need to navigate from one website to another also some of the application does not have a feature to book the destination. Also, in the 21st century we need to carry our documents like national ID, passport and other for making a valid booking. We need to rely on offline travel agents to book the services. Additionally, if you are a travel agent and you need to go online then s/he should build the whole application which gets very costly to the small level or medium level travel agents/agency.

1.3. Project as solution

TravelMate has a very user friendly design and has a packages of a various destination which helps in seamless booking. The users can upload their documents so that they can get rid of carrying their respective documents. TravelMate integrates various services like weather, currency exchange, and news so that the user should not navigate to various destinations. The users themselves can customize the package the way of travelling, number of travelers and their suitable dates. Small level as well as medium and big level travel agent can also get connected with TravelMate to enhance their business and scale up the travel industry. This project, TravelMate has almost everything the travel management system should have.

1.4. Aims and Objective

TravelMate aims to provide the user friendly platform with package booking of the destination which includes transportation, accommodation and many more in a budget friendly environment and to take the travel agents on-board to make sustainable tourism.

The objectives of travel web application are:

1. Seamless Trip planning
2. Secure and efficient booking
3. Continuous improvement and innovation

4. Provide a platform for travel agents
5. User friendly design

Hence, these are the aims and objective of TravelMate.

1.5. Artefact

1.5.1. Functional Decomposition Diagram (FDD)

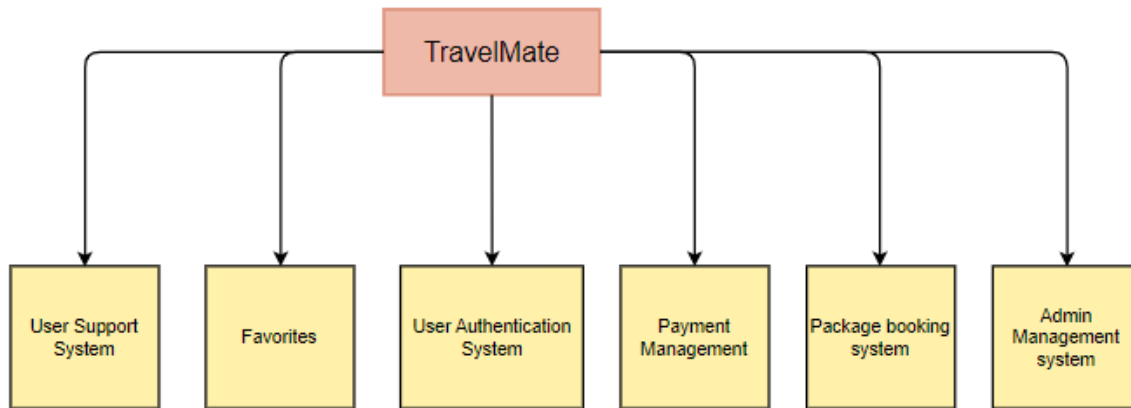

Figure 1: Functional Decomposition Diagram (FDD)

1.5.2. Explaining system as a whole

TravelMate has a major six sub systems which includes: User authentication system, package booking system, favorites, user support system, payment management and admin panel. These six sub systems make TravelMate a full application for travel booking and management system. Every sub system as very crucial and has its own major importance in their respective field. The sub systems includes, exclude and other parts are explained bellow:

1.5.3. Sub-systems

a. User Authentication

Users can register themselves by creating an account to access the web application while creating an account user should provide their authentic email address as email

verification link is send to the respective user's email address until and unless the user does not verify the email the user is not allowed to be logged in. Here, the user gets the option to recover their password if s/he has forgotten also the password reset link is sent to the user's registered email address.

b. Search and sort Destinations

When the user search for the destination and the destination is available the respective destination will be displayed with the package and the information about the destination through which users can see through. In the other hand, the user can sort the destination using sort filter by price low to high and high to low.

c. Booking and reservation

In order to book the destination user must be logged in. The users can only select the future dates and can customize on their own. The selection of the date can be customized, number of travelers can be customized and method / way of travelling i.e. transportation can also be customized as per user's budget and comfort. For the reservation purpose, the user can pay the respective package amount online as well as book now and pay later.

d. Customer support

If the user or agents has any problem, queries then s/he can navigate to the contact section where there are three methods of contacting which includes: writing a problem here s/he can write a problem and the TravelMate's team will look through it. Next is writing a mail, my clicking an email s/he can directly contact TravelMate's team. Lastly, s/he can write a message in WhatsApp where the message goes to the TravelMate's support representative. Also, the users can find all the terms and conditions which can be helpful.

e. Admin panel

Admin can manage the edit and delete their users or can make them admin. Admin can delete the destination if found fraud or has any problem in it. The system's admin can

view and delete the bookings also can view the submitted documents by the user and can delete them.

f. Travel Service provides / agents

TravelMate allows a simple steps for travel service providers. The agents can login and in the profile section they can add a destination and can provide a service. After the booking is successful the agent will be informed via mail form TravelMate.

g. Others

TravelMate has other features like weather forecast, currency exchange, application information and the latest news which helps to gather all the major features required in travel application. This helps user to keep them in TravelMate and solves the problem of navigating from one application to another for these information.

1.6. Academic Question

The academic questions are:

- Who are the users of TravelMate?
- How can a TravelMate address the challenges travellers face in planning and executing their trips smoothly while meeting the demand for personalized experiences?
- How do you tackle with offline travel agencies?

1.7. Scopes and Limitations of the project

The scopes and limitations are:

Scopes:

1. Destination information

The detailed information about the destination / the service provides can provide. Exclude and includes in the package which helps in the clarity while booking the package.

2. User-friendly interface and accessible on all devices

The user will be able to be very friendly with the system, simple UI design with best service will be included. This web application can be accessed by all the web browsers and will be screen friendly as well.

3. Booking services integration

The packages will be displayed and the user can book the packages with different options provided and while selecting the dates the users can only select the date after two days as TravelMate needs time to make the arrangements. While selecting the transportation only bus and airplane is added till now further can be added in future.

4. Document upload service integration

The essential document required to book the package like passport, National ID, citizenship etc. can be uploaded which helps in hustle free booking also helps in booking the flights, bus, room or any other services if required.

5. Scalability

TravelMate is built to make it scalable because today TravelMate has only one category which is destination in the near future hotels can also be listed because it's now providing a service for travel agents so there is high probability of the hotels owner being listed. Transportation service can be integrated not the package based but only transportation. Shops / ecommerce for the travel related accessories can also be listed.

6. Destination information and recommendation

Detailed information can be added about the destination and using Artificial Intelligence (AI) based on user's choice and the destination can be recommended.

7. Accessibility

Various accessibility can be added like changing the language, making a text bigger or smaller, change the images or the color for color blindness users.

Limitations:

1. Dependence on external data

The quality and accessibility of external data sources, which are prone to change, may have an impact on how precise and appropriate the information are.

2. Device Compatibility

Although every attempt will be made to guarantee a responsive design, there can be restrictions regarding the best possible presentation and functionality on specific devices, particularly those with unusual screen sizes or features.

3. Sustainable data accuracy

The precision of sustainability-related elements, like ecological footprint estimates, could depend on the availability of trustworthy data and might be impacted by changes in environmental conditions.

4. Continuous improvement iteration

Resource obstacles, such as time limitations and the skills of a single developer, may limit the capacity to provide constant modifications.

5. Limited 3rd party API

In order to get the data all the free API may not provide the correct information and paid API may have the high amount.

Hence, these are the scopes and limitation of TravelMate.

1.8. Report Structure

The report structure consist of:

a. Introduction

The introduction talks about the statistics data which is helpful for why to build the travel management system and the importance of the travel industry.

b. Project Briefing

This part talks about the TravelMate its introduction, end users and the materials required to take a brief description about TravelMate. Problem statement, academic questions are listed.

c. Aims and Objective

Here, is the major aims and objective the TravelMate has while building this application and wants to fulfill the aims by completing the objective.

d. Artefact

This section of the report consist of functional diagram which shows the major sub systems the project will include and the explanation of all the major sub systems.

e. Scopes and Limitations of the project

This section includes the scopes and limitation of TravelMate which is briefly explained.

f. Literature Review

In this section I have reviews five research papers related to travel, tourism, and travel booking systems and studied about the similar systems of TravelMate.

g. Project Methodology

In this section of the report, the methodology is discusses as which methodology and why I have chosen this methodology, how will this methodology helps my project.

h. Tools and Technology

In this section of the report, the tools and technology that is used to build the system TravelMate is discussed. The packages installed, icons taken from, API keys and other tools and technology which helped to complete the project.

i. Artefact Designs

In this section of the report, various diagrams, System requirement specification (SRS), testing are discussed. This section helps to understand the system more closely and more precisely.

j. Conclusion

This section of the report talks about the overall conclusion of the report and system.

k. Critical Evaluation of the Project

This section of the report discuss in depth about the strength, weakness, threats and areas of improvement of the project.

l. Evidence of project management

This section of the report displays the evidence of project management which includes the log sheet with respective supervisor's signature and Gantt chart which helps to track the project.

m. References

This section of the report provides the reference or citation of the respective which from which I have taken the data or information and re-wrote in my own words.

n. Appendices

This section of the report provides the further evidence of the system which includes wireframes, actual designs and the result of the survey.

2. Literature Review

I have reviewed majorly five research paper based on various travel, travel management, booking and other vital topics which are useful and somehow intended to be implemented as well.

a. Travel Planning Management System

The "TRAVEL PLANNING MANAGEMENT SYSTEM" project automates all travel and tourism-related procedures, including creation, booking, confirmation, and user information. In order to construct travel packages, the administrator can add hotels, transportation services, place management, and travel packages to the system. After that, users can log in and reserve any number of packages, as well as create bespoke ones. By paying for the package, the consumer can validate their reservation.

Additionally, User can register themselves and start to create a plan trip where the packages can be customized. For the payment, this project used the card method which asks all the necessary information of the card's owner and the payment would be successful. This project includes transportation management, hotels management, accommodation management, place management. This project includes all the necessary elements required for a travel web application. Through a detailed analysis of user experiences and system performance, the research provides valuable insights into the effectiveness of the Travel Planning Management System in meeting the growing needs of modern travellers. The paper not only highlight the technical aspects of the system but also evaluates its practical effects for both users and the travel industry, contributing to the ongoing discourse on digital solutions in the empire of travel planning. (Gunathilake & Samarasekara, 2022)

b. Exploring the Transformation of Digital Tourism: Trends, Impacts, and Future Prospects

The journal article, "Exploring the Transformation of Digital Tourism: Trends, Impacts, and Future Prospects," presents a comprehensive analysis of the progressing landscape in the travel industry. The study explores major trends that are reforming the field of digital tourism and emphasises the extensive influence of technology breakthroughs. The report notes that the ways in which travellers plan, enjoy, and share their travels are being increasingly impacted by enlarged and virtual reality, artificial intelligence, block chain, and smartphone, web applications. It explores the significant effects of these developments, including the standardizing of travel by making it accessible to a worldwide audience, the overturning of conservative business models by online platforms, and the change in consumer behaviour towards relying more on technology when making decisions.

Furthermore, the study presents promising opportunities for the digital tourist industry in the future. The authors highlight how advances in technology, opening the door to customized travel experiences. It is emphasized that integrating new technologies, including as 5G and the Internet of Things, is essential to improving connection and enabling seamless, real-time services. The piece also highlights the importance of contactless and health-focused travel experiences following COVID-19, imagining a time when wellness tracking and digital passports are commonplace. All things considered, this study offers insightful information about the revolutionary forces reshaping the digital tourist scene and offers industry participants a road map for exchanging this dynamic and always changing environment. (R.Sivarethinamohan, 2023)

c. Analysis and Design of Tourism Recommender System for Religious Destinations of Nepal

The research paper titled "Analysis and Design of Tourism Recommender System for Religious Destinations of Nepal" presents a thorough investigation into the development and implementation of a specialized recommender system personalised for religious tourism in Nepal. In addition to importance the main features and algorithms used to provide travellers interested in religious places with personalised recommendations, the report presents comprehensive findings from the system's analysis and design phases. The research highlights the usefulness and efficiency of the Tourism Recommender System, highlighting its potential to improve the experience of journey and religious tourism in Nepal through a mix of data analysis, user feedback, and system testing.

Moreover, the study explores the wider implications of the created recommender system, underlining its function in advancing religious tourism, protecting cultural assets, and enhancing Nepal's tourism sector as a whole. Understanding user preferences, behaviour, and satisfaction levels helps researchers better understand how technology-driven solutions might benefit the travel and tourism industry. Researchers, industry professionals, and legislative bodies looking to use recommender systems to improve the tourist experience in places of worship and promote sustainable tourism development in Nepal will find great value in the conclusions and design considerations presented in this research paper. (Shrestha, et al., 2020)

d. Smart Tourism Technologies - A Key to Success and Survival for Sustainable Eco-tourism Development in Dooars Region (West Bengal)

The research paper titled "Smart Tourism Technologies - A Key to Success and Survival for Sustainable Eco-tourism Development in Dooars Region (West Bengal)" offers a broad exploration of the role of smart tourism technologies in raising sustainable eco-tourism development in the Dooars region of West Bengal, India. The studies clarify how cutting-edge technology like data analytics, mobile applications, and the Internet of Things (IoT) can be integrated to improve the effectiveness and sustainability of eco-tourism projects. The research shows how these developments can help to preserve natural resources, reduce environmental impact, and enhance the overall tourism experience in Dooars through a thorough examination of the region's distinctive ecological features and the application of smart technologies.

Furthermore, In order to ensure the sustainability and prosperity of ecotourism in the Dooars region, the article examines the strategic implications of implementing smart tourism technology. It looks at how using these technologies can draw in eco-aware travellers, enhance destination management, and guarantee the sustainability of eco-tourism projects in the long run. The research contributes to the academic discourse on sustainable tourism development by offering practical guidance for stakeholders, policymakers, and local communities involved in eco-tourism efforts in the Dooars region of West Bengal. The recommendations and insights provided are based on empirical data and case studies. (Chanda, et al., 2022)

e. Role of Information Technology in Tourism Industry: Impact and Growth

The research paper titled "Role of Information Technology in Tourism Industry: Impact and Growth" investigates the multidimensional influence of information technology (IT) on the tourism sector, providing wide-ranging findings on its impact and the ensuing growth trends. The study explores how information technology (IT) has revolutionised the travel business by simplifying a number of processes, including reservation systems, marketing, consumer interaction, and communication. The study illustrates how the integration of IT has boosted operational efficiency, enhanced customer experiences, and created a more integrated global tourist scene by examining factual data and industry trends. The results highlight the critical role that IT plays as a growth accelerator and provide insights into the dynamic and changing interaction between technology and the travel and tourism sector.

Also, the study also looks at how adopting IT may affect various stakeholders in the tourism industry. It highlights the necessity for innovation and adaptation while discussing how the rapid improvements in IT have affected organisations, travel destinations, and consumers. The study also clarifies the difficulties that come with implementing IT in the tourism industry, including issues with cyber security and the technological gap. All things considered, the study is an invaluable tool for scholars, policymakers, and industry professionals, offering a cultured perspective of how information technology affects the expansion and advancement of the travel and tourism industry. (Wahab, 2017)

2.1. Similar System

I have mentioned five similar system which are similar in terms of my application's feature or function, every system as their own importance and its own unique feature. Some feature may be collided some may not be collided. The similar systems are:

a. Make my trip

Make my trip is the Indian web application where you can book the entire package as well as hotels, transportation and other elements in terms of travelling. Make my trip has a detailed information about all the necessary items like date of arrival, total days, cost, hotels, sight-seeing places. The package can also be customized in some of the destinations. (MakeMyTrip, 2024)

Features:

- a. User can login and signup.
- b. User can customize their package.
- c. User can book the package online.
- d. National and international destinations are available.
- e. Complete itinerary about the destination is displayed.

b. Ace Travels

Ace Travels is the Nepali web application which offers the package reservation of national and international destinations. In Ace travels, the information about the destination with cost is only displayed the booking cannot be done online in order to book the package we need to fill up the form and contact to the administration. (AceTravels, 2024)

Features:

- a. It has national and international destination.
- b. For booking, you need to fill up the form and contact to the administration.

- c. Complete itinerary about the destination is displayed.

c. Travel Triangle

Travel Triangle is both web and mobile application which offers the package reservation of Nepali and international destination. In travel triangle, various destinations are displayed and the destination can be filtered using various methods. The surficial information about the destination is only displayed where as to get the detailed information we need to fill up the form and provide our phone number and email address where the information about the trip will be messaged or mailed respectively. (TravelTriangle, 2021)

Features:

- a. User can login and signup
- b. For booking, we need to choose our options and the price is quoted according to our respective needs and the estimated price will be informed.
- c. ChatBot is available for assistance.
- d. Destinations are classified as various subtopics like hill station, nature, religion etc.

d. Yatra

Yatra is the Indian web application which offers the package of the international destinations. All the information regarding destinations and shown completely also the inclusive and exclusive are displayed which makes user to be more comfortable with the application and to book the package. Various sorting methods are includes where we can find our own comfort on which way of travelling or package booking makes us ease. (Yatra, 2024)

Features:

- a. Users can login and signup into the system.
- b. National and international destinations are displayed.

- c. Users can apply online visa application from Yatra to different countries.
- d. Inclusion and exclusion of the packages are displayed clearly.

e. Mytrip2nepal

Mytrip2nepal is the Nepali web application which offers the package booking of various national and international destinations. All the information are displayed but the package cannot be booked online. All the itinerary are displayed. Here, we cannot customize the package and we cannot be filtered as well. (mytrip2nepal, 2018)

Features:

- a. User can login and signup into the system
- b. You can just make an inquiry of the place / package but you cannot book online.
- c. National and international destination of mainly Asia is displayed and you cannot search for the destination.

2.2. Comparison of TravelMate with other similar systems

The comparison of TravelMate with its other similar system are:

TravelMate	MakeMyTrip	Ace Travels
It has login and signup system.	It has login and signup system.	It does not have login and signup system.
You can book the packages.	You can book the packages.	You cannot book the packages.
You can customize your bookings.	You can customize your bookings.	You cannot customize your booking online.
You can upload your documents. (National ID, passport etc.)	You cannot upload your documents.	You cannot upload your documents.
Only destination of Nepal are available for now.	International Destinations are available.	International Destinations are available.

The research articles highlight the mutually beneficial link between technology and the travel industry, highlighting the ways in which technological developments have transformed a number of features of tourism, from recommender systems and sustainable eco-tourism initiatives to planning and management systems. These developments improve customer experiences, expedite corporate processes, and promote sector expansion. This tendency is further demonstrated by the incorporation of technology into travel firms and online applications like as MakeMyTrip, Ace Travels, Travel Triangle, Yatra, and Mytrip2nepal, which offer a variety of features tailored to suit the needs and tastes of their users. MakeMyTrip provides extensive booking options and customization tools; Ace Travels and Travel Triangle offer surficial information and manual booking processes, respectively. While Mytrip2nepal focusses on domestic and international

destinations but does not offer online booking, Yatra excels in providing comprehensive information on foreign destinations. When taken as a whole, these findings highlight how crucial technology is to the development of the contemporary travel scene, encouraging innovation, sustainability, and improved user experiences.

3. Project Methodology

Scrum is an Agile-based framework, and it's the methodology I've decided to use for my project. Scrum is a well-liked and successful method for developing software since it provides an organized but adaptable process through iterative cycles called sprints. Every sprint has a predefined time frame, usually two to six weeks, in which a pre-planned list of tasks needs to be finished. Scrum's emphasis on ongoing stakeholder feedback, which enables iterative modifications and enhancements throughout the development process, is one of its main advantages.

A number of specified events, such as Sprint Planning, Daily Scrum, Sprint Review, and Sprint Retrospective, form the foundation of Scrum. These gatherings create an atmosphere that is transparent and cooperative, promoting self-organization and time-boxing to guarantee that activities are finished quickly. Scrum places a strong emphasis on basic values like commitment, attention, honesty, and respect in addition to principles like adaptability and continuous progress. By encouraging these principles, Scrum seeks to improve work and product quality by delivering incremental value through frequent cycles of development and feedback. (Scrum, 2023)

In my project, TravelMate, tasks are broken down into small, feasible sprints, which helps to organize and reduce the overall amount of work. With each work being done in its allotted sprint, this divide enables a focused approach that guarantees timely completion and high-quality results. Following every sprint, a review is held to obtain input that is subsequently utilized to improve and fine-tune the ensuing phases of development. In addition to guaranteeing that the project remains in line with user requirements and expectations, this iterative method enables ongoing modification and development, which is essential to producing a successful end product.

4. Tools and Technology

I choose to combine React.js, Express.js, Node.js, and MongoDB in my project TravelMate because they all work together to create a strong and effective full-stack development framework. Utilizing its component-based architecture to guarantee a smooth and engaging user experience, React.js was crucial for developing a dynamic and responsive user interface. Because of this, I was able to create UI components that are reusable, which improved maintainability and development speed. The development of Restful APIs and server-side logic was made easier by Express.js, which was based on Node.js and provided a stable and adaptable framework for managing HTTP requests and routing on the server side.

Node.js's non-blocking I/O approach was essential in enabling great performance and efficiency, which were particularly vital for managing several simultaneous connections and real-time data processing. Without the need for difficult database migrations, MongoDB's flexible schema architecture was ideal for maintaining the varied and dynamic data. As the user base expands, TravelMate's scalability guarantees that it can manage growing volumes of data and traffic. I was able to design a unified, scalable, and maintainable application that satisfies the requirements of contemporary web development by utilizing this mix of technologies. (MangoDB, 2023)

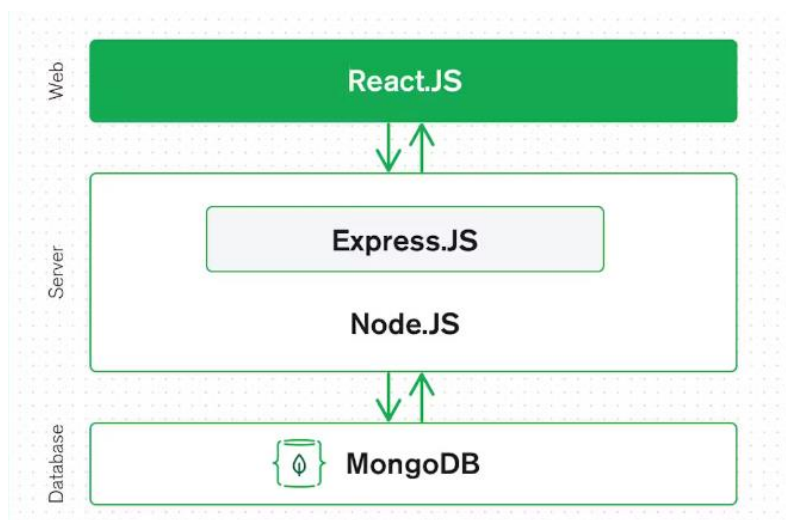

Figure 2: MERN Stack Workflow

Source: <https://www.mongodb.com/mern-stack#:~:text=MERN%20stands%20for%20MongoDB%2C%20Express,that%20make%20up%20the%20stack.>

GitHub will be used for backup and version control in this project. It will be simpler to save codes and monitor the project's progress with GitHub's assistance. The code can be manually committed from the browser or it can be committed into GitHub using command line code. The weather's API is taken from openweathermap.org and news's API is taken from NewsData.io whereas the API of currency conversion is taken from Frankfurter. For icons it's taken from hero icons and react-icons.

5. Artefact Designs

The artefact designs are:

5.1. Data flow diagram (DFD)

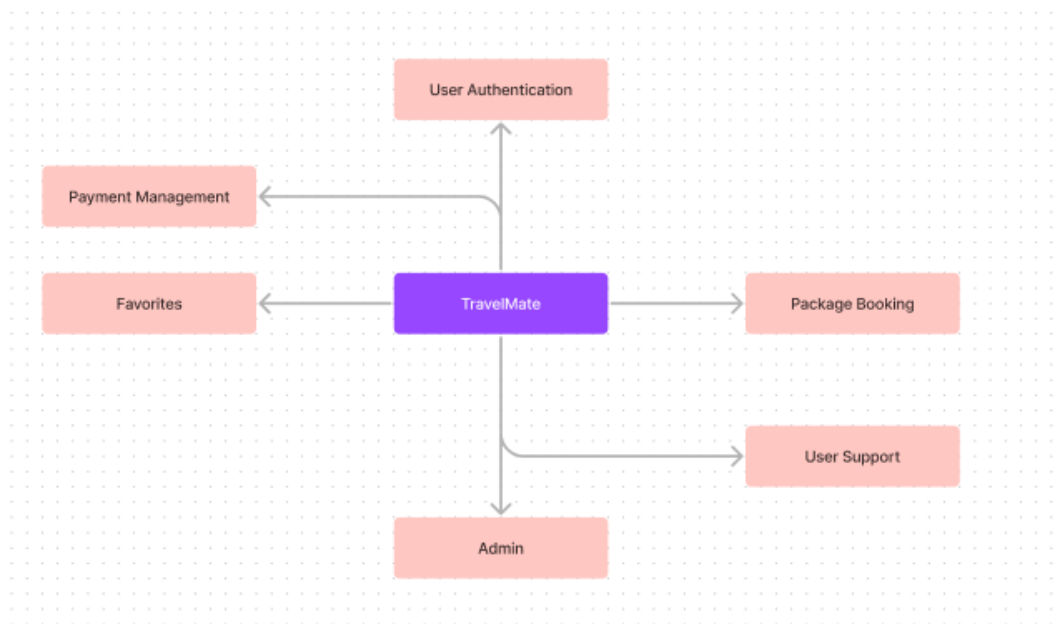

Figure 3: DFD Level zero

The "TravelMate" Level 0 Data Flow Diagram (DFD) shows the system as a single process interacting with different internal and external functions. Admins and Users are examples of the external entities. In order to communicate with TravelMate, users must submit support requests, favorite destinations, booking packages, login credentials for authentication, and payment information for transactions. Users can get payment

confirmations, booking confirmations, saved favorites, authentication status updates, and support replies from TravelMate. Administrators can transmit and receive system reports, user activity logs, and administrative commands with TravelMate. User authentication, payment management, managing package booking, handling favorites, and user support are among TravelMate's primary internal operations. Without going into detail, this high-level overview shows the main data flows between the system and its external entities.

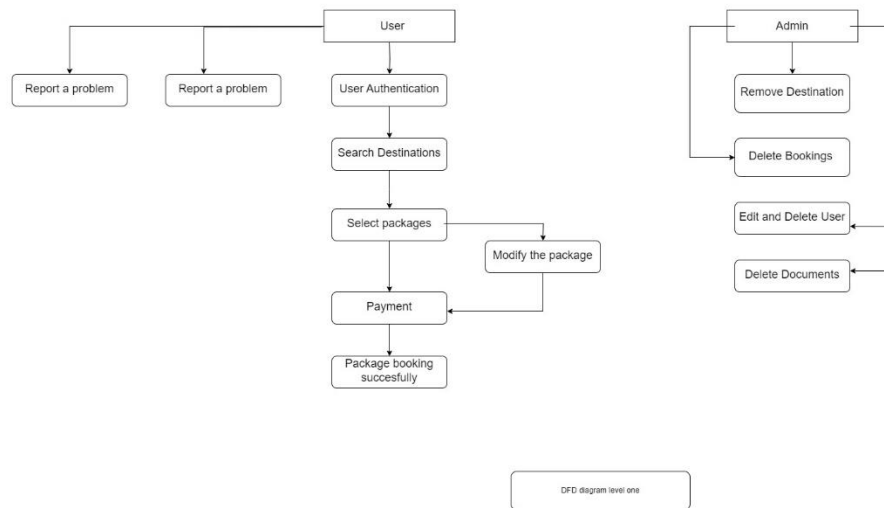

Figure 4: DFD Diagram level one

IN DFD level one diagram, it is the little extended version of DFD zero. This diagram helps to look into the system with the features the system has. It outlines thorough processes and data flows within the system.

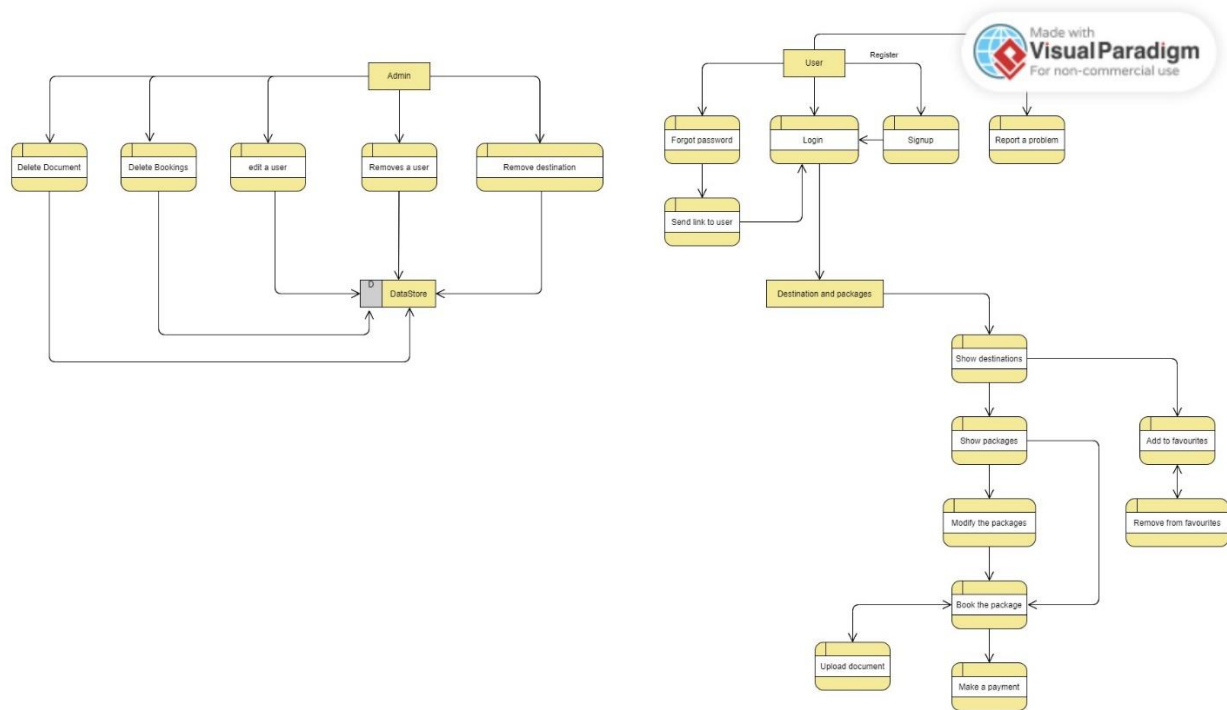

Figure 5: Level two DFD Diagram

The system is broken down into specific sub-processes in the Level 2 Data Flow Diagram (DFD) for "TravelMate" to improve understanding. With an admin function in charge of the system, the main operations are managing user, viewing and deleting documents, destinations, bookings. User authentication processes user credentials and authentication status and manages login, registration, and password resets. Users can add, remove, and see their favorite places through the Favorites procedure. Package booking entails looking for packages, making reservations. Users interact with these processes by providing inputs like credentials and booking.

5.2. Use case diagram

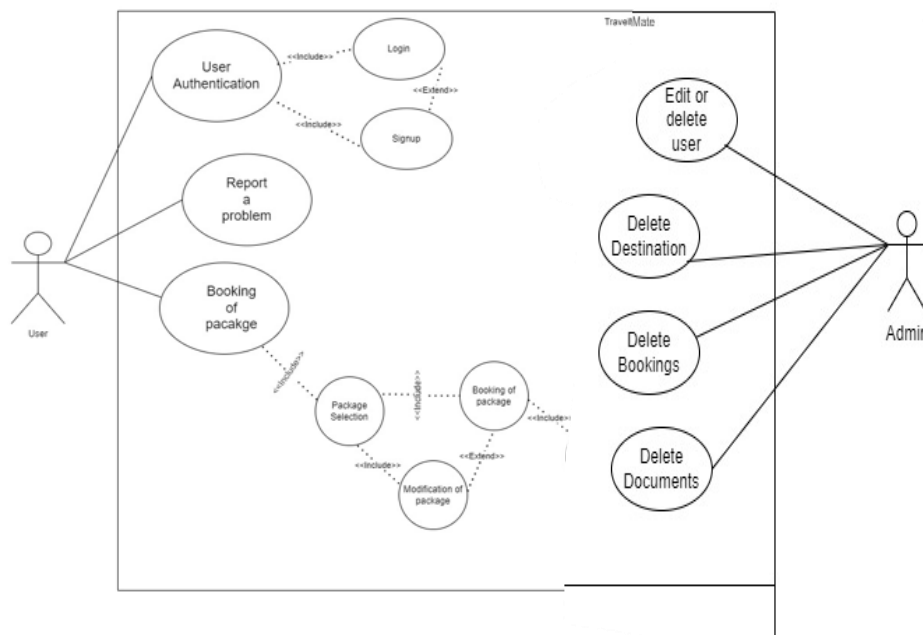

Figure 6: Use case diagram of TravelMate

The system TravelMate's Use Case Diagram shows how administrators and users interact with the system to accomplish different objectives. In case they need to, users can reset their passwords, create an account, and log in. They can look at comprehensive packages and book the available travel destination's package users can edit package details, add or remove packages from their favorites, upload necessary document, and make payments. They can also report any issues they come across. Adding and removing individuals as well as controlling trip packages and viewing and deleting the user's document are among the unique features available to administrators. This diagram highlights the important interactions and use cases while offering a clear overview of the system's operation from the viewpoints of administrative and normal users.

5.3. Sequence Diagram

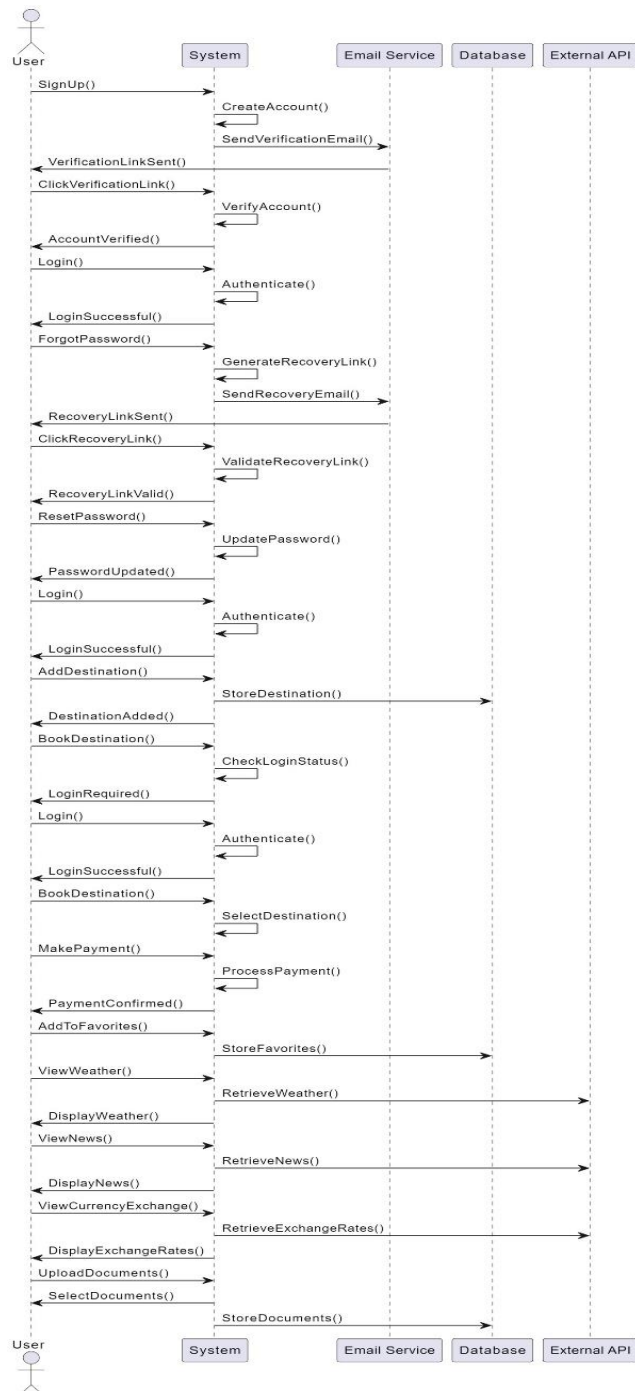

Figure 7: Sequence Diagram of TravelMate

In the above figure, sequence diagram illustrates the sequence of task that can be performed in TravelMate.

5.4. Class Diagram

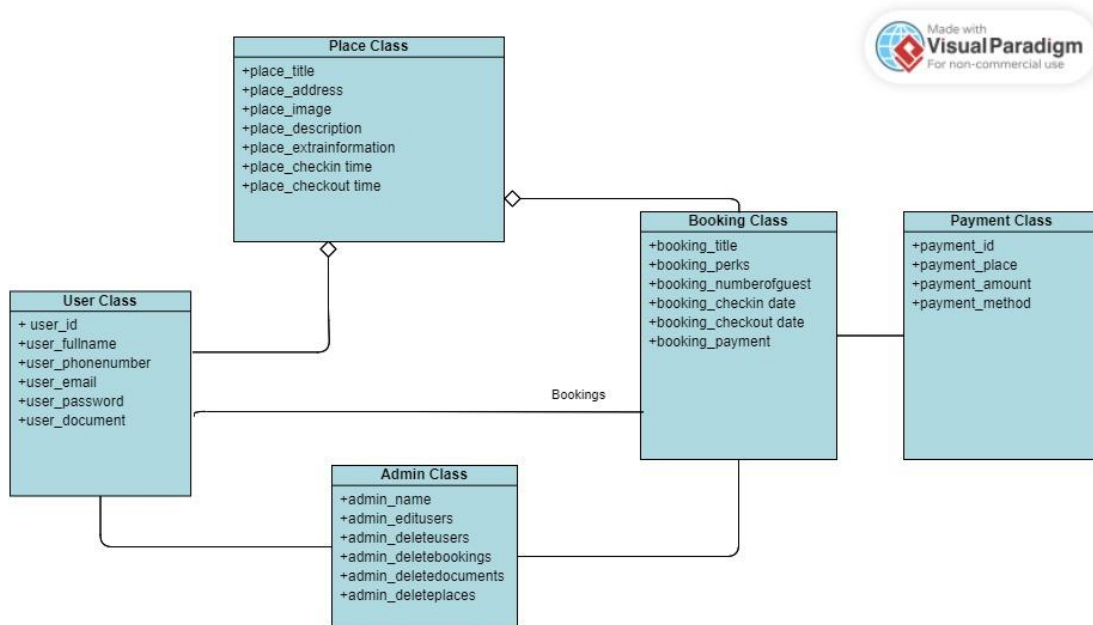

Figure 8: Class Diagram

Four primary classes make up the booking system depicted in the class diagram in the picture: Place, User, Booking, and Payment. Place_title, Place_address, Place_image, Place_description, Place_extrainformation, Place_checkin time, and Place_checkout time are some of the elements of the Place class. Attributes like user_id, user_fullname, user_phonenumber, user_email, user_password, and user_document are part of the User class. Booking_title, Booking_perks, Booking_numberofguest, Booking_checkin date, and Booking_checkout date are all contained in the Booking class. The Payment class also has payment_method, payment_amount, payment_place, and payment_id. The graphic also illustrates the connections between these classes, demonstrating that a User is able to reserve a place and pay for it. The structure and interactions between the many elements in a booking system are depicted at a high level in this figure.

5.5. User Authentication System

System Requirement Specification (SRS)

Introduction

Users can create and maintain their accounts with the help of the user management system. This includes changing passwords, deleting user accounts, and logging in and log out.

Product Functions

- a. User registration
- b. User login
- c. User logout
- d. User password reset
- e. User document upload

Functional Requirements

Required Code	Required Description
FR-1	Users can register for an account on the platform by providing their complete name, phone number, working email address, and password.
FR-2	The system will check the user's email address provided during registration to ensure it is formatted correctly, and then send the reset link to that address.
FR-3	By inputting their email address and password, users will be able to access their accounts on the platform.

FR-4	If the user forgets the password, then user should enter their valid email address registered in TravelMate.
FR-5	If a user wants to, the user will write a problem or email to delete their account.
FR-6	After login the user should be able to upload their documents

Non-Functional Requirement

Required Code	Required Description
NFR-1	The system should respond quickly when a user registers, logs in, or resets their password.
NFR-2	To safeguard user information, a high level of security must be implemented in the system.
NFR-3	The system should be able to handle a large number of users without degradation in performance.
NFR-4	High availability and uptime are required for the system to guarantee that users can always access it.

Usability requirement

Required code	Requirement description
UR-1	The procedure ought to be clear-cut and simple to comprehend.
UR-2	Every page must have the same user interface.

Diagrams

Entity Relationship Diagram (ERD)

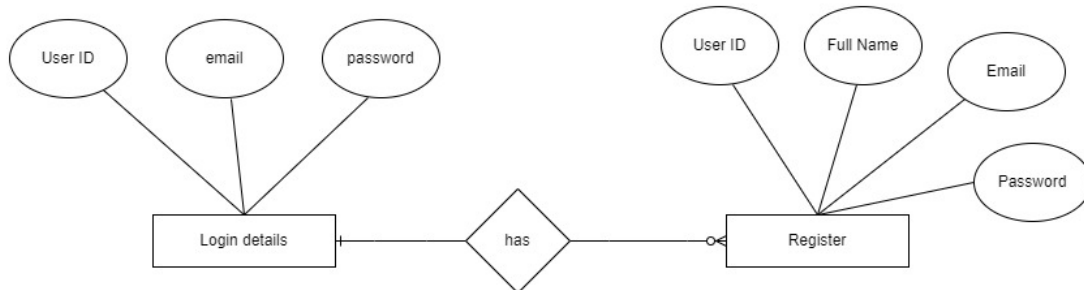

Figure 9: ERD diagram

Data Dictionary

Field Name	Data type	Description
Full Name	String	Full name of user
Email	String	Valid email address of user
Number	Integer	Contact number of user

Activity Diagram:

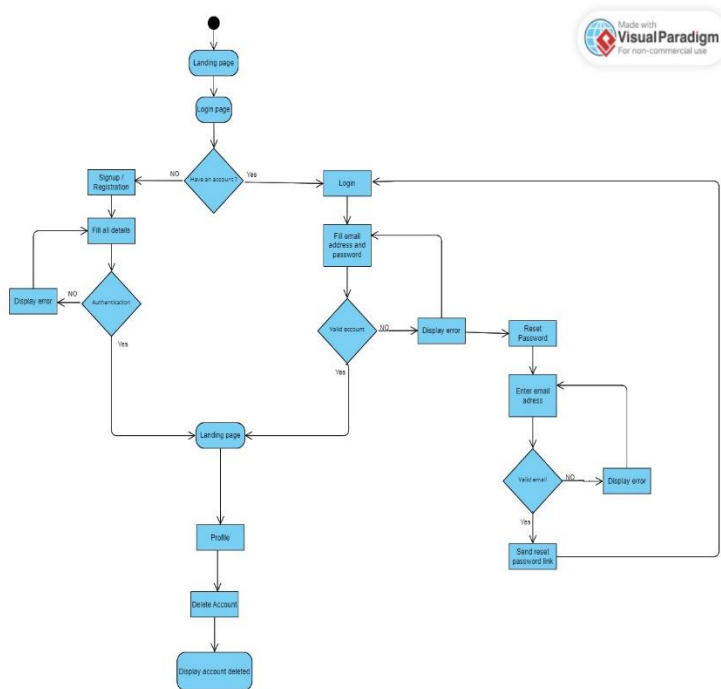

Figure 10: Activity Diagram of user authentication

The activity diagram starts from the landing page and shows how a user interacts with a system. The user has the option to log in or sign up from this page. In the event that the user chooses to register, they are asked to enter their information and any mistakes are shown. The user is taken back to the landing page once successfully completing the account creation process. The user is required to input their credentials if they decide to log in. After any issues are fixed, the user is either taken to their profile or receives an email requesting a password reset and email verification. The user can view their details of their account from the profile page. Standard symbols are used in the diagram: rounded rectangles for activities, diamonds for decision points, and arrows to show the flow's direction. This graphic tool is a useful tool for interpreting and evaluating user behaviour inside the system.

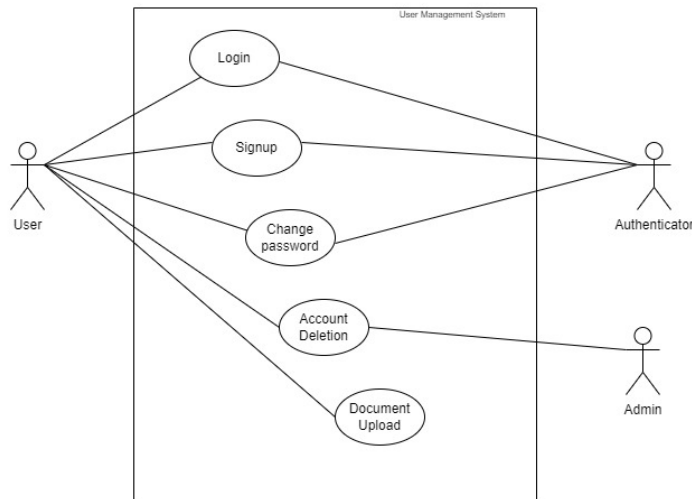

Use case diagram:

Figure 11: Use case diagram of user authentication

Three actors—"User," "Authenticator," and "Admin"—represent a User Management System in the use case diagram shown in the picture. All five use cases—"Login," "Signup," "Change Password," "Account Deletion," and "Document Upload"—can be interacted with by the "User." "Authenticator" interactions include "Login," "Signup," and "Change password," whereas "Admin" interactions are edit and delete the user. This User Management System diagram shows who can do what within the system and gives a clear picture of it. It's a useful tool for understanding system needs and user interactions.

Sequence Diagram

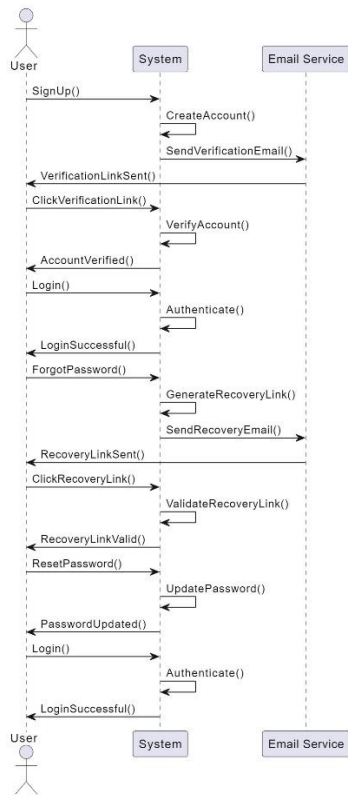

Figure 12: Sequence Diagram of user authentication system

Testing

Test case: User login, signup, forgot password

S.NO	Test Details	Expected Result	Actual Result	Status
1.	Incorrect email address and password entered	Display error (Login failed)	Displays same error	pass
2.	Correct email and password entered	User logged in	User successfully logged in	pass
3.	Existing email is entered on signup	Display error (Failed to register user)	Shows error	Pass

4.	Logging in without getting verified	Show error	Shows error	Pass
5.	Non existing email on forgot password is entered	Show Failed to send password reset link	Shows the error	Pass
6.	logging without entering credentials	Display error(Please fill all fields)	Shows error	Pass

5.6. Package booking system

System Requirement specification (SRS)

Introduction

The package booking system display all the destinations that are available and allows user to view the package edit the package and book the package.

Product functions

- a. Display the destinations
- b. Allows user to sort the information by price high to low and low to high
- c. Enable user to buy a customizable package
- d. Enable user to book the package

Functional requirement

Required code	Requirement description
FR-1	The application should show the destinations
FR-2	The application should allow user to sort the information by price high to low and low to high
FR-3	The package should be customizable (conditions may differ)
FR-4	The package should be booked online
FR-5	User should be logged in

Non-Functional Requirement

Required code	Requirement description
NFR-1	The price should be accurate and the destination information should be accurate.
NFR-2	The information should be from reliable information.
NFR-3	Every elements of package should be customized.

Usability Requirement

Required code	Requirement description
UR-1	The presentation of the destination information should be clear, logical, and easy for people to comprehend.

UR-2	The destination data sorting, comparison, and filtering procedure should be simple to understand and carry out.
------	---

Diagrams

Entity Relationship Diagram

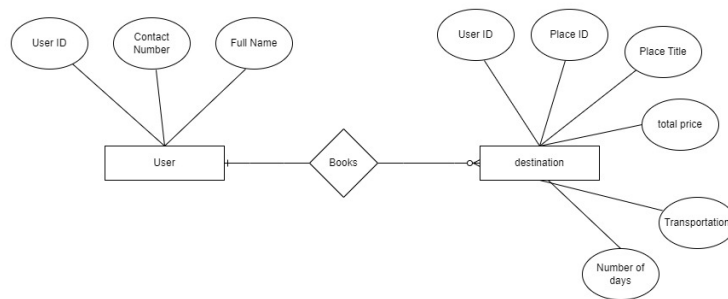

Figure 13: ERD Diagram of package booking

A User Management System is depicted in the image as an Entity-Relationship Diagram (ERD). There are four components to it: "User," "Books," "destination," and "Transportation." Every entity possesses unique qualities. The "User" entity, for instance, has the following attributes: "User ID," "Contact Number," and "Full Name." Through relationships, the entities are related to one another. "Books" and "destination" are linked to the "User." The crow's foot sign next to "Transportation" denotes a one-to-many relationship between "destination" and "Transportation." This ERD may serve as a booking or travel management application, enabling users to reserve travel locations and modes of transportation. It's a useful tool for comprehending how data are connected within a system.

Activity Diagram:

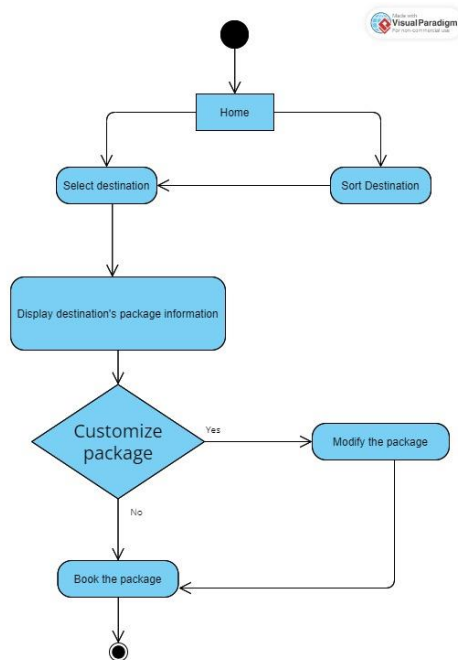

Figure 14: Activity Diagram of package booking system

An itinerary booking system's decision-making process is represented in the activity diagram in the picture. It begins at the "Home" node and divides into the "Select destination" and "Sort Destination" concurrent operations. Following these actions, the system shows the package details for the chosen destination. The choice of whether or not to customize the package must then be made. The user can alter the bundle if they so want; if not, they can book the package right away. The last node in this flow denotes the end of the travel booking procedure. This short illustration shows how customers can make changes to their packages before completing their reservation.

Use case diagram:

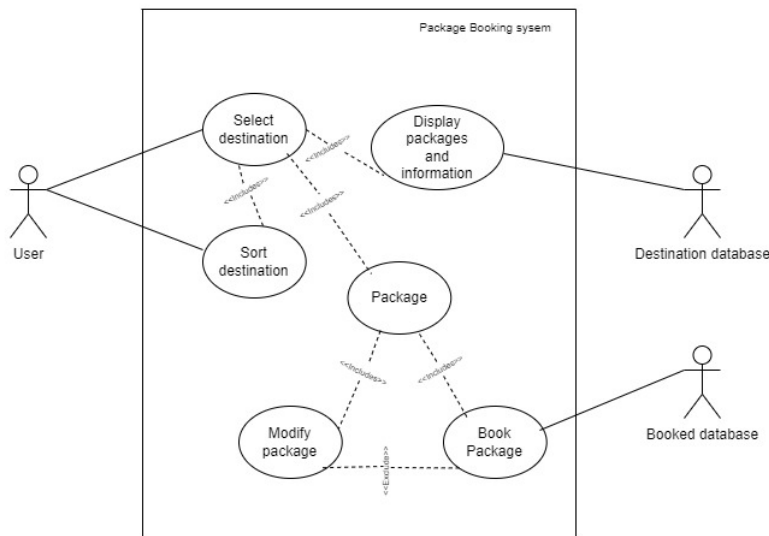

Figure 15: Use case diagram of package booking system

The "Package Booking System" is represented in the use case diagram in the above picture. It describes the different ways that a user can communicate with the system. The "User," the "Destination database," and the "Booked database" are the actors in this diagram. "Select destination," "Sort destination," "Display packages and information," "Modify package," and "Book package" are some of the use cases. The actors' interactions are depicted using lines connecting these use cases to them. The boundary that all of these activities occur within is identified as the system itself. This graphic illustrates the features offered to users and the data flows between various systems components when they engage with a package booking system. It's an excellent resource for comprehending how users and systems interact when booking packages.

Testing:

Test Case: Package booking

S.NO	Test Details	Expected Results	Actual Results	Status
1.	Clicking the displayed destination	Navigate to the destination	Navigated to the destination	pass
2.	Selecting the past days in check in date	Selection of date is not allowed	Date cannot be selected	pass
3.	User is not logged in and tried to book the package	Error (please log in to complete your booking)	Showed the same error	pass
4.	Negative days are selected	Hide the booking button	The booking button is hidden	pass
5.	Make book now option and show payment is pending	The booking is made payment is pending	Showed same result	pass
6.	Make online payment and book destination	The place is booked	Showed same result	pass

5.7. User management system

System Requirement Specification

Introduction

If the user has any errors or problems, they can email the development team about them. If the user has special requests or wants to speak with the admin directly, they can send the admin a message by email or message them on WhatsApp.

Product function

- a. User can write a problem also can give a feedback to the development team.
- b. User can contact to the admin via main or WhatsApp.

Functional Requirements

FR-1	User can report their problem
FR-2	User can contact to the admin via mail and WhatsApp.

Non-functional Requirement

NFR-1	Reporting of a problem should be like a real time chat
NFR-2	Not every problem or requirements can be solved

Usability Requirement

UR-1	The reporting of a problem will be effective
UR-2	Every response will be replied
UR-3	The page will be easy to understand

Diagrams

Activity Diagram:

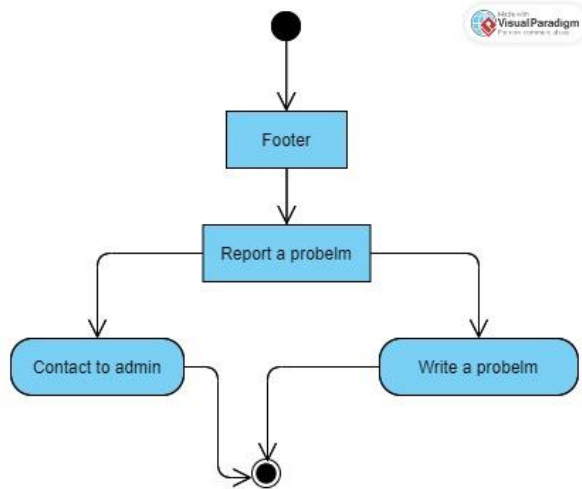

Figure 16: Activity Diagram of User/customer management system

The activity diagram illustrates how to report an issue with a system—possibly a website or an application. The user can select to "Report a problem" at the system's header or Footer, where the procedure starts. The user has two choices after reporting an issue: they can "Write a problem" or "Contact to admin" directly. Once one of these steps is completed, the process is over. The procedures a user would follow to report an issue with this system are depicted in this flowchart in an easy-to-understand and brief manner. It's a helpful tool for comprehending how users and systems interact while reporting issues.

Use case diagram:

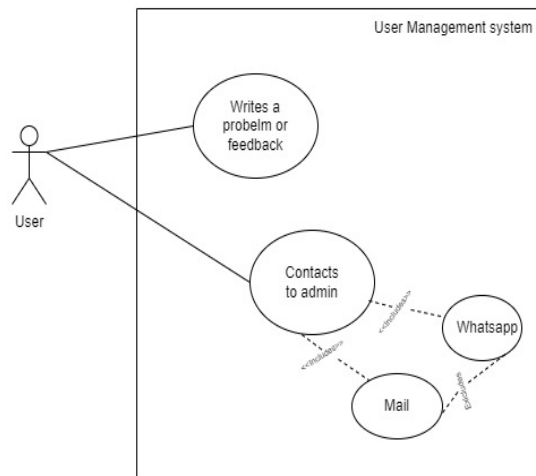

Figure 17: Use case diagram of user management system

Testing

Test case: contacting and writing a problem

S.NO	Test Details	Expected Results	Actual Results	Status
1.	Writing a problem goes to the admin	The form should be empty	The form is empty	pass
2.	Without writing anything clicking send button	Show required	In the field its shown required	pass
3.	By clicking mail the email can be written	Mail should be opened and just you have to write the problem and send	Mail send is successful	pass

4.	By clicking WhatsApp is opening and redirecting to the respective number	Redirect is successful and message can be send	Whatsapp is opened and can be send message	pass
----	--	--	--	------

5.8. Destination listing

System requirement specification

Introduction

The destination is added by the user themselves who want to provide the service using TravelMate.

Product function

- a. Destination should be added and should be displayed in home page
- b. Clear information about destination

Functional Requirement

FR-1	The destination should not be submitted blank
FR-2	The destination information should be provided
FR-3	The numbers should not be in negative

Non-functional Requirement

NFR-1	Every image should be uploaded from link
NFR-2	The data should be authentic and should be reliable

Usability requirement

UR-1	In all destination the position should be same
UR-2	It should be easy to navigate

Diagram:

Activity Diagram:

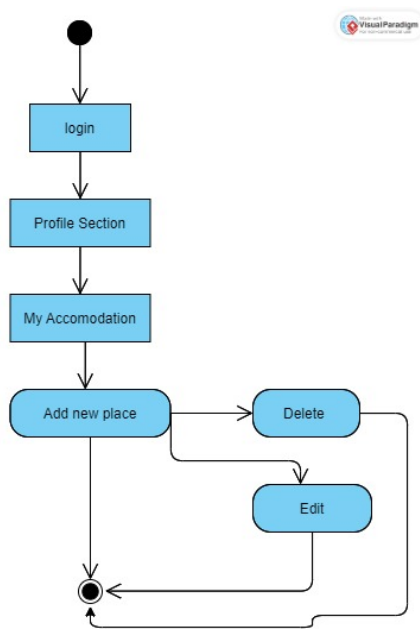

Figure 18: Activity Diagram of adding destination

The activity diagram starts from login and this part is for the service providers, after login you can go to the profile section and after the profile section to my accommodation there you can see the add new place button when we click the button the form will open you have to enter the details and the destination will be displayed in front.

Testing

Test case: Adding destination

S.NO	Test Details	Expected Results	Actual Results	Status
1.	Submit without adding any details	Place validation failed	Showed place validation failed	pass
2.	Upload image by URL	Successfully uploaded	The image is uploaded	pass
3.	Number of days can be in negative	The number cannot go below 1	The number is not going bellow 1	pass

5.9. Payment management system

System requirement specification

Introduction

In order to book anything online payment is the most necessary factor to confirm the booking. The amount of the packages will be transferred to the admin using payment gateway service.

Product function

- a. Enable user to make a transaction
- b. Make a booking

Functional Requirement

FR-1	User should be able to make a transaction of the selected package.
FR-2	After the payment is successful the package should be booked

Non-functional Requirement

NFR-1	Every payment gateway should be implemented
-------	---

Usability Requirement

UR-1	The payment method should be easy to comprehend
------	---

Diagrams

Entity relationship diagram

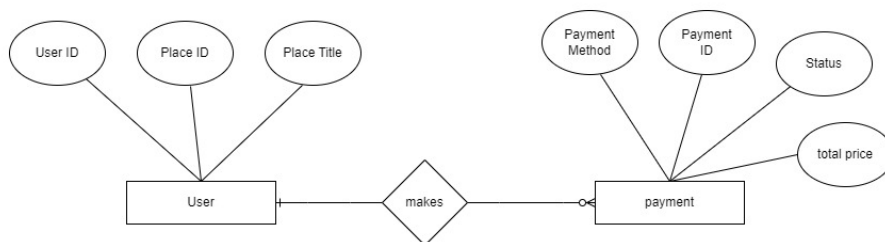

Figure 19: ERD diagram of payment

Activity Diagram

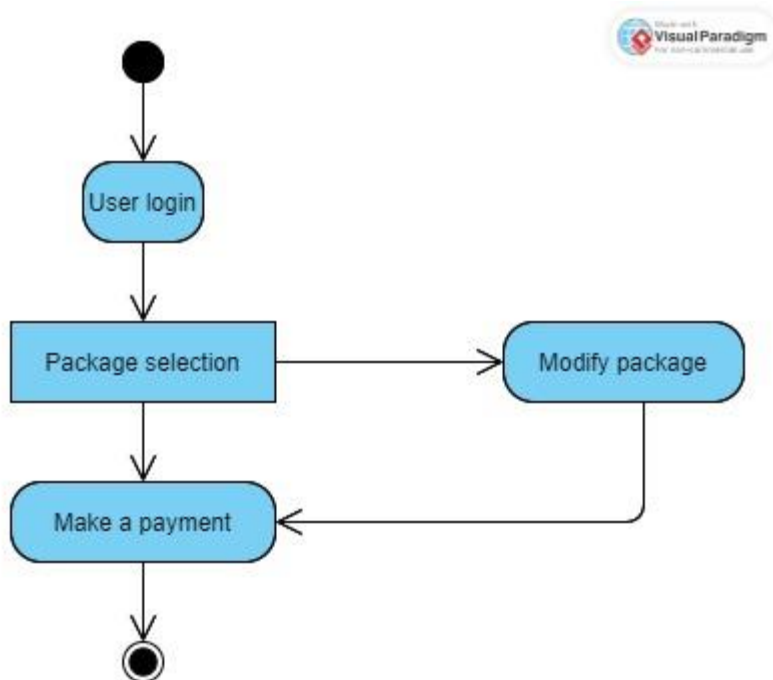

Figure 20: Activity diagram of payment management system

An activity diagram shows a system's flow of actions. The process starts with the user logging into the system and then choosing a package. The user might choose to change the package they have chosen after making their selection. Following selection (and perhaps modification) of the package, the user pays. The filled circle in the diagram represents the beginning of the process, and the circular filled circle represents the end. The arrows show the flow of control from one activity to the next. The specifics of each step can be conditional on the context of the system being modeled. The labels in the diagram provide the basis for this interpretation.

Testing

Test case: user should be able to make a payment and book the destination

S.NO	Test Details	Expected Results	Actual Results	Status
1.	User can book the destination without making payment	Payment failed	Showed same error	pass
2.	User make a successful payment and package is booked	Payment successful and redirect to booked page	Showed same message	pass

5.10. Weather, currency conversion and news

System requirement specification

Introduction

These feature helps to enhance the TravelMate. Also, these feature is the must features of travel applications.

Product function

- a. Should be able to display the data

Functional Requirement

FR-1	The data should be displayed
FR-2	All the fields like search / dropdown all should work

Non-functional Requirement

NFR-1	The data displayed should be accurate
NFR-2	In currency exchange each and every country's data should be available

Usability Requirement

UR-1	The design should be user friendly and should be easy to use
------	--

Testing

Test case: weather, currency exchange, news

S.NO	Test Details	Expected Results	Actual Results	Status
1.	User search for valid destination in weather	Weather display	Weather is displayed	pass
2.	Wrong location is entered	Error City not found	Same error is displayed	pass
3.	Currency can be converted	Converted data is displayed	The output is displayed	pass
4.	Latest news are displayed	News should be displayed from various sources	News are displayed	pass

5.11. Admin

System requirement specification

Introduction

In any system Admin has a major work to do and a major role to be followed, to control the overall system admin is needed.

Product function

- a. Graphical representation of data
- b. Major parts should be covered from admin panel

Functional Requirement

FR-1	It should display the same data stored in database
FR-2	CRUD operation should be done

Non-functional Requirement

NFR-1	Every information can be edited and deleted by admin
NFR-2	All the data should be displayed after clicking the user

Usability Requirement

UR-1	The design should be easy to use
------	----------------------------------

Diagrams:

Activity Diagram:

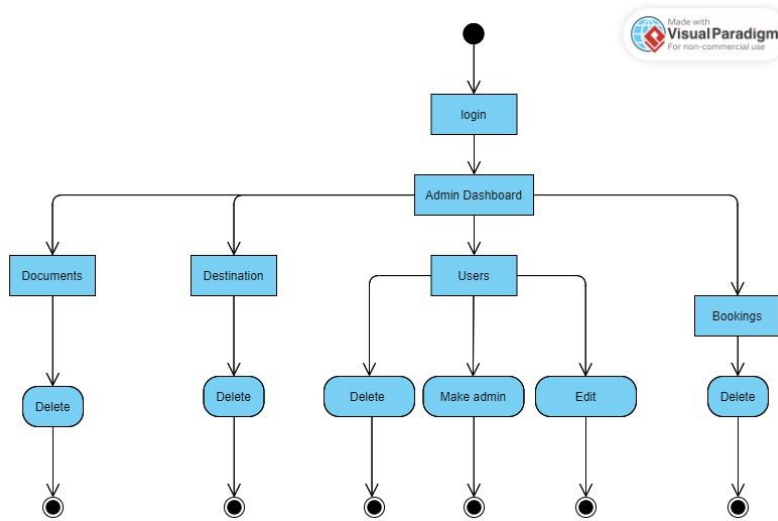

Figure 21: Activity Diagram of admin panel

The above activity diagram shows a system's flow of operations, emphasizing administrative role in particular. The Admin Dashboard is accessed after an admin logs into the system. Three parallel channels lead from the dashboard to the destinations, users, and documents. Every path has a unique set of steps. For example, the Users path breaks further into actions like Delete, Make admin, and Edit, while the Documents and Destination paths both lead to a Delete action. Additionally, there is a branch from the Users that goes to the Bookings activity and then to the Delete action. This figure offers an understandable visual depiction of the various options and routes accessible within a system following login.

Use case diagram:

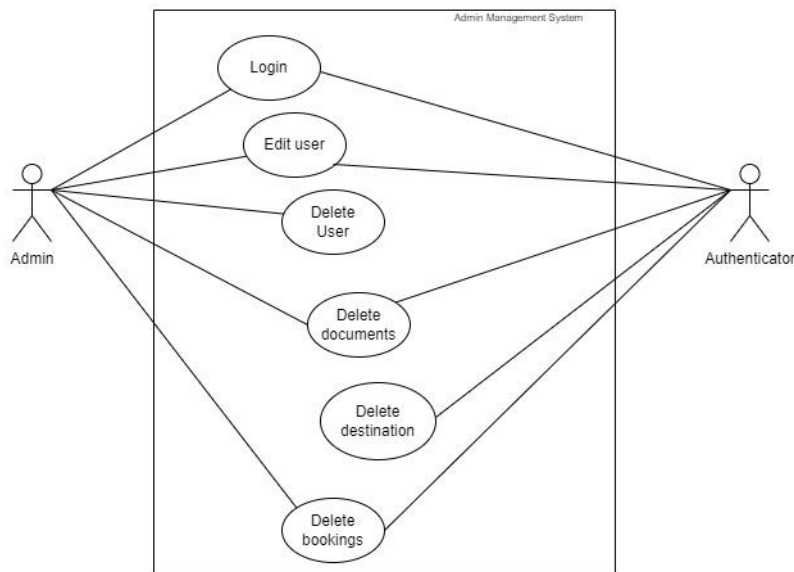

Figure 22: Use case diagram of admin panel

The features of an admin management system and how various users interact with them are depicted in the use case diagram in the picture. Authenticator and Admin are the two actors in the system. All of the features in the Admin Management System are available to the admin, including the ability to log in, edit, delete, and remove documents, destinations, and bookings. However, the fact that the Authenticator is only linked to the Login function suggests that this actor's involvement may be restricted to the system's authentication procedures. Who can do what in this particular software or system environment is clearly summarized in this diagram.

Testing

Test case: Admin

S.NO	Test Details	Expected Results	Actual Results	Status
1.	Users data display	The data in database and in admin panel should match	The data matches	pass
2.	Admin can view the user's data and can edit it	The data should be changes in database	The data is changed	pass
3.	User can view bookings and documents and can delete them	The data should match from database and should be deleted	It can be deleted and can be viewed	pass
4.	Admin can make a user admin	Role should be admin in database	The role is changes from user to admin	pass
5.	Admin can delete places	By clicking the button the place should be deleted	The place is successfully deleted	pass

6. Conclusion

In conclusion, TravelMate is a very well thought out and implemented product that seeks to completely transform the market for digital travel platforms. The choice to apply the Scrum methodology demonstrates its dedication to adaptation and flexibility, enabling iterative platform improvement based on input from stakeholders and changing user needs. Furthermore, choosing a MERN stack for development offers a solid basis that makes it possible to build a full-stack solution that is both scalable and effective. Utilizing technologies such as React.js, Express.js, Node.js, and MongoDB, TravelMate guarantees a flexible and adaptable user interface that fulfils the expectations of modern travelers.

TravelMate also shows a thorough awareness of customer requirements with its complete system specifications for user identification, package booking, user management, and supplementary functions like weather updates, news and currency conversion. TravelMate guarantees to provide a smooth and engaging travel experience from planning to booking and beyond through careful preparation and execution. Because of the project's emphasis on innovation, usability, and dependability, TravelMate is positioned as a leader in the digital travel industry.

TravelMate is expected to have a big influence as it continues to develop and test, providing users with a state-of-the-art platform that meets their varied demands and preferences. By keeping a close eye on customer happiness and making constant improvements, TravelMate hopes to raise the bar for travel technology innovation. TravelMate is more than simply a project; it's a vision of the travel platforms of the future, where convenience, dependability, and seamless experiences come together to improve every traveler's experience. It does this by placing a high priority on cooperation, innovation, and user-friendly design.

7. Critical Evaluation of the Project

Every aspects has its own advantage and disadvantage, positive and negative aspects, Strength and weakness. Similarly, TravelMate has its own, the critical evaluation of TravelMate is:

Strength: The strength of the project are:

User Experience: The TravelMate's user interface is very aesthetic and easy to comprehend, layout is well organized making it simple to navigate without prior guidance. Users can get the features they want without getting lost in navigation. The rules of Schneiderman's Golden Rules and Nielsen's list of Usability Heuristics is also implemented in designing.

Destination Information: The required information is all included, full location of the destination including province, district also when we click the location it redirect to the Google map which further helps user to get the clarity about the destination. The clear images of the destination is also available which makes user more comfortable and reliable while booking the destination. Also, the service provider's name is also provided which makes user who is offering the package.

Booking Details: The user can customize their own booking plan as the service provider only provides the check-in and check-out time from which location, the provider doesn't specify the date which means user can book their desired date themselves. The date can only be selected after preset day+1 as TravelMate needs time to make the arrangements. If the user selects the negative number of days the booking button will not appear also looking towards the user's comfort the package is offered in various transportation and the package can be booked either by paying online or also can be paid later.

Features: The user can get various services other than booking like checking weather, converting currency and reading news which helps to increase the user's engagement in the application. While taking a survey many people have made their interest positive on uploading of document which helps in booking and helps to minimize the crimes that may arise. Authentication of email is also very useful and helpful in many aspects like forgot password, to contact user.

Methodological Approach: One of the main advantages is the application of the Scrum methodology. Iterative development and ongoing feedback are made possible by this agile structure, which is crucial for efficiently addressing user wants and supervisor changes. It increases adaptability and lets the team make small, iterative changes based on feedback and real-world usage.

Technological Stack: The strong and scalable MERN stack MongoDB, Express.js, React.js, and Node.js is utilized in TravelMate. This option enables scalability, high performance, and efficient development processes—all essential for managing the potentially large number of data and users that a travel application may experience.

Weakness: The weakness or the area of improvement of the project are:

Limited to API: In the application various data is needed in order to make the system reliable. In the application, the weather of all the cities are not available and failure in the source of API the system will not work. In currency conversion, the currency of all the nation is not available. Even after making the filters in news API sometimes the news are shown in different languages. There is no one hundred percent guarantee for the authentic data also to get the appropriate authentic data we need to subscribe for the continuous data without any interruption.

Lack of optimization: While the application offers lists which are added first, there aren't many options for users to customize their choice the application only has sort by price high to low and vice-versa. By providing user with more option, user fulfilment would increase and a greater variety of population might be satisfied.

Inadequate information: TravelMate is well aware to provide the information about the destination, about the booking but cannot reach to the every aspect of the system. If TravelMate intends to give the full information the application would be more about the knowledge rather than the booking.

Collaboration with travel guides: Travel guides are the gem of travel industry but presently TravelMate doesn't include the travel guides in it as many places of Nepal like

Mount Everest, mustang, Annapurna Base Camp (ABC) and remote areas the guides are necessary. Guides make the travel meaning full as they are the part of the local they are well aware about the culture, religion the norms and values of different places. Government has made compulsory to have guides in some of the destination as well. This feature can also be added which makes the travel more reliable and provides the best hospitality for the travelers.

Lack of real-time customer support: A potential downside of the user management system could be the absence of a real-time chat function for customer assistance, even though users can report issues and get in touch with the admin via email or WhatsApp. When consumers in the travel sector encounter pressing problems, prompt response can greatly increase customer satisfaction.

Limited customization in package booking: Travel packages can be fairly customized using the system, although conditions may vary according to the user's requirements. In the event that the customization options are not as versatile as anticipated, this uncertainty may cause user annoyance. Increased personalization possibilities and more precise instructions might make users happier.

Security Concerns: Strict security measures are required when handling sensitive user data, such as payment details and the documents any sort of mismanagement might lead to serious problem. The use of secure connection for payment gateways are not mentioned in the project, however specific security procedures and adherence to PCI DSS (Payment Card Industry Data Security Standard) compliance are not covered in detail. To preserve trust and safeguard user data, it is imperative to implement strong security measures.

Testing and Quality assurance: Despite being thorough, the testing part mostly concentrates on functional testing. There is no mention of non-functional testing domains like security testing, and performance testing. These elements are essential for guaranteeing that the system is safe from possible attacks and able to manage large user loads.

Opportunity: Some of the opportunities of TravelMate are:

Highly scalable: Presently, TravelMate has only package for the destination in the near future if this project is launched then the categories can be created with hotel booking, bus booking or rental, car booking or rental, flight reservations and many more. The only task would be to add the category and get the service provides, owners on board. In the context of Nepal, there are no such reliable online travel agents who offers these services together or the services TravelMate provide now.

Enhance Personalization: It may be possible to provide more individualized travel offers and recommendations by using AI and machine learning to analyze user preferences and behavior. User delight and engagement would increase as a result.

Expansion to higher segment of the society: The platform might look exploring ways to grow into more specialized travel markets, such luxury, adventure, and eco-tourism. Providing services that are customized for particular market positions may attract in a larger user base.

Threats: Some of the threats that may arise are:

Technological changes: If TravelMate doesn't constantly innovate and adapt, the rapid developments in technology could become a threat. Remaining competitive requires keeping up with evolving technologies and user expectations.

Regulatory Challenges: Travel platforms have to negotiate complicated legislative frameworks in many nations, particularly when it comes to data privacy (such as the GDPR in Europe). Ensuring faithfulness to several regulations can be difficult and require significant resources.

Competitive Market: There are many well-known competitors in the aggressively competitive digital travel platform business, including Expedia, Booking.com etc. In order to gain market share, TravelMate need to set itself apart. Failure to offer unique value intentions could limit its success.

To sum up, TravelMate is a well-thought-out project with a wide range of features made to accommodate different traveler needs. Its strong technology stack, agile development methodology, and extensive functionality are its main advantages. It must, however, overcome a number of obstacles, such as the requirement for better assistance, more possibilities for customization, and strict security measures. Through the resolution of these shortcomings and the use of prospects for integration, customization, and market growth, TravelMate can establish itself as a strong contender in the digital travel sector. Its success in an aggressive and quickly changing business will depend on its commitment to constant innovation and user experience.

8. Evidence of project management

PROJECT MANAGEMENT LOG	
First Name: <u>Enirodha Dhanraj</u>	Surname: <u>Dhanraj</u>
Student Number: <u>2206847</u>	Supervisor: <u>Mr. Arun Kc</u>
Project Title: <u>TravelMate</u>	Month: <u>January</u>
What have you done since the last meeting	
I have done research of my system's available research paper, also about the similar systems. I have completed three literature review and five similar system review.	
What do you aim to complete before the next meeting	
To complete literature review. To complete similar system review.	
Supervisor comments	
To increase the part of similar system To reduce unnecessary part of literature review.	

We confirm that the information given in this form is true, complete and accurate.

8.2. Gantt Chart

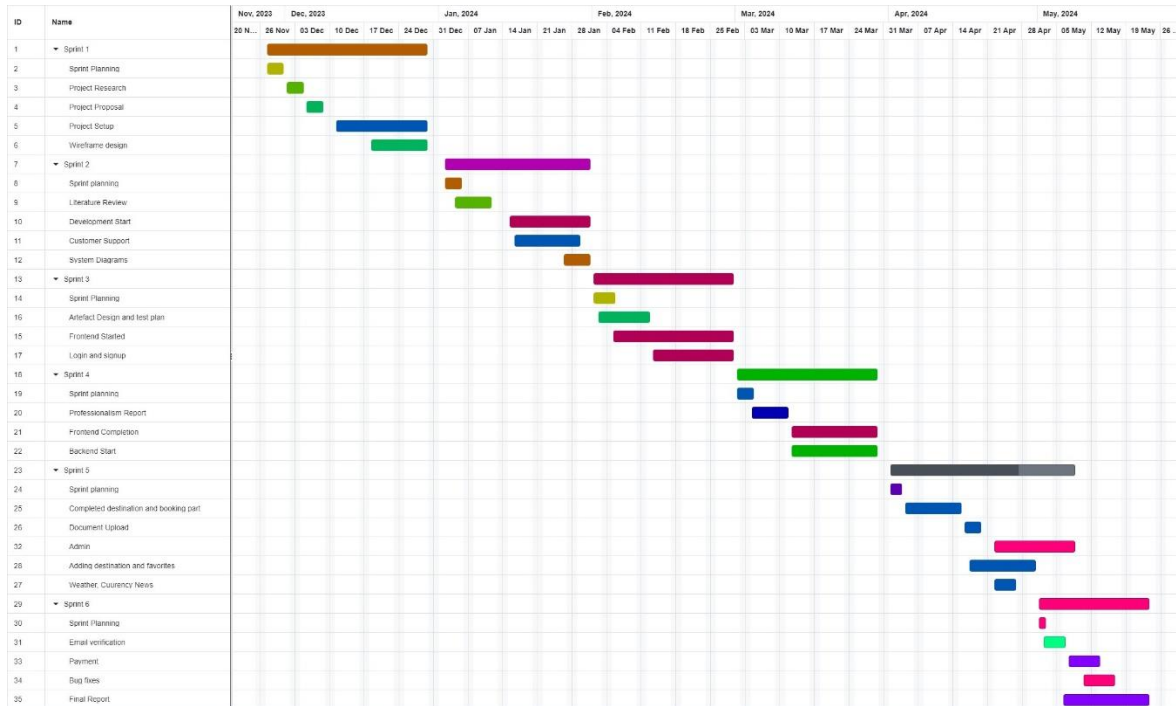

Figure 39: Gantt chart

Gantt chart is a project management tool used to schedule, organize and coordinate tasks within the project. Gantt chart is according to the scrum methodology and it has the sprint wise task division can be seen in the above figure. The tasks in this chart are overlapping which means the task was re-maintained looked back into the task. The tasks are represented by a bar, the position and length determines the start date, duration and end date of the task.

10. Appendices

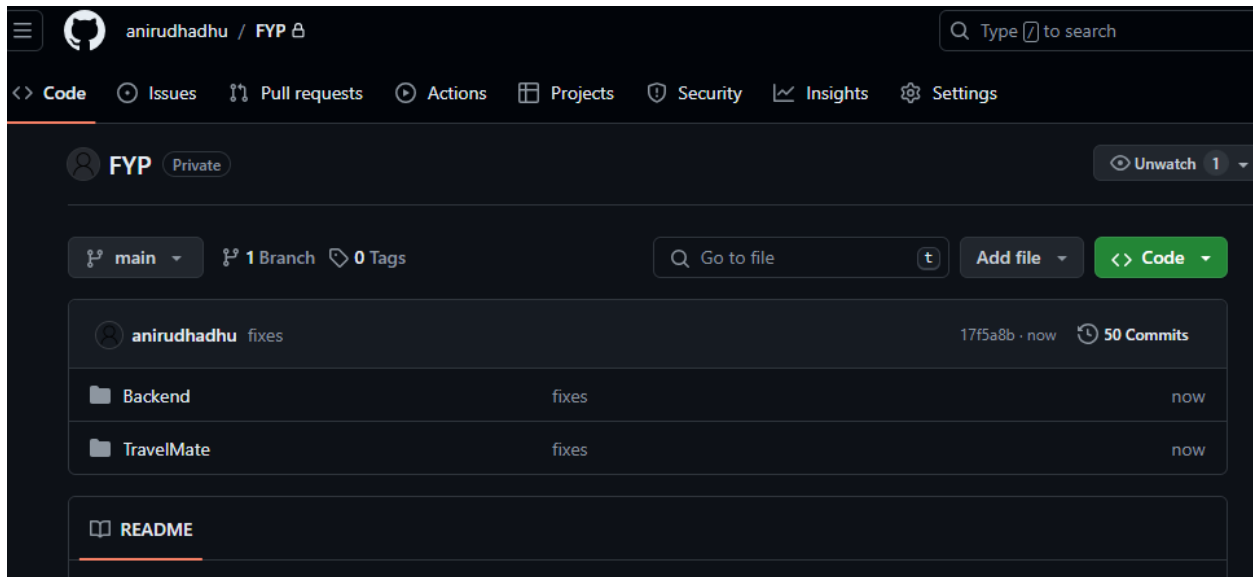

Figure 40: GitHub Commits

GitHub is used to control the version and to store the codes for backup. Total 50 commits is made to complete the project TravelMate.

10.1. Key Frames

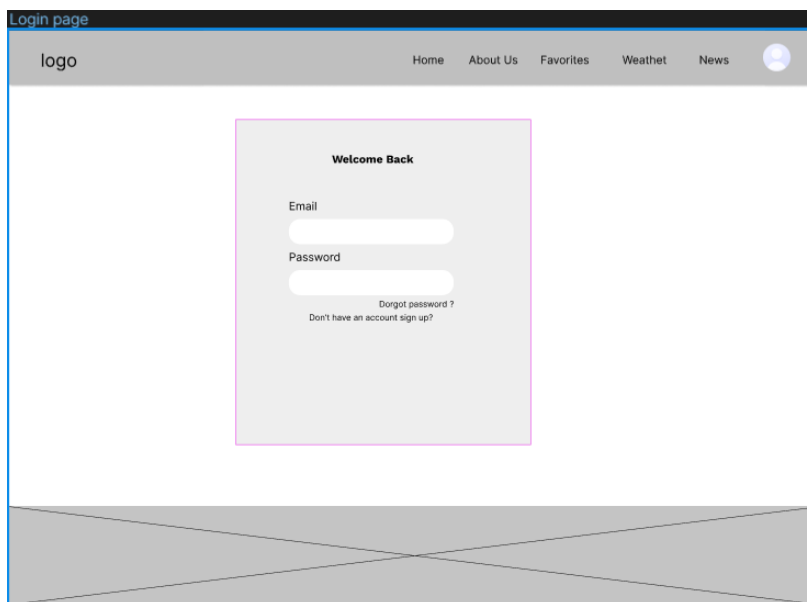

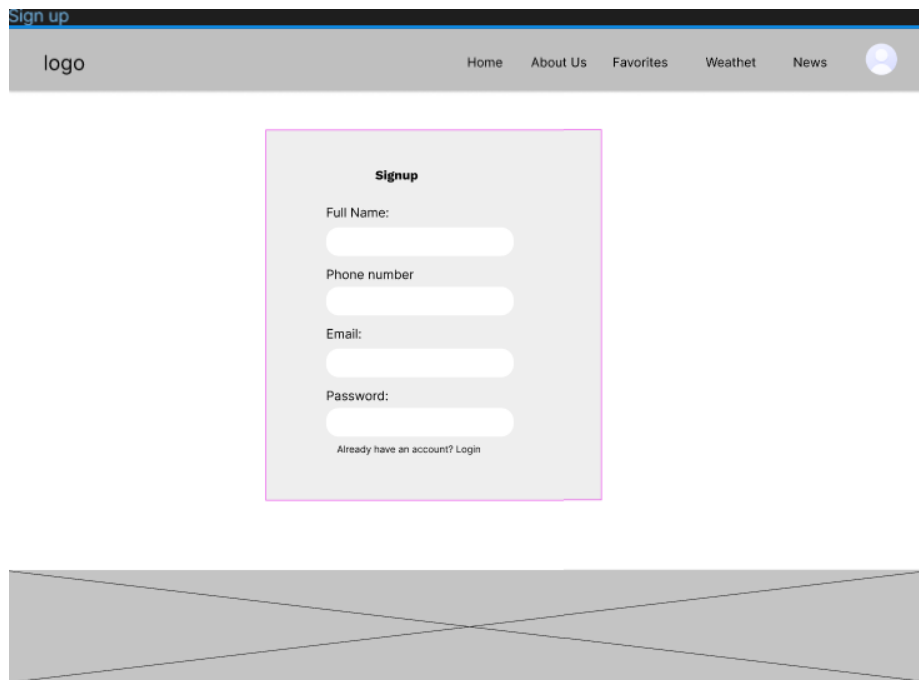

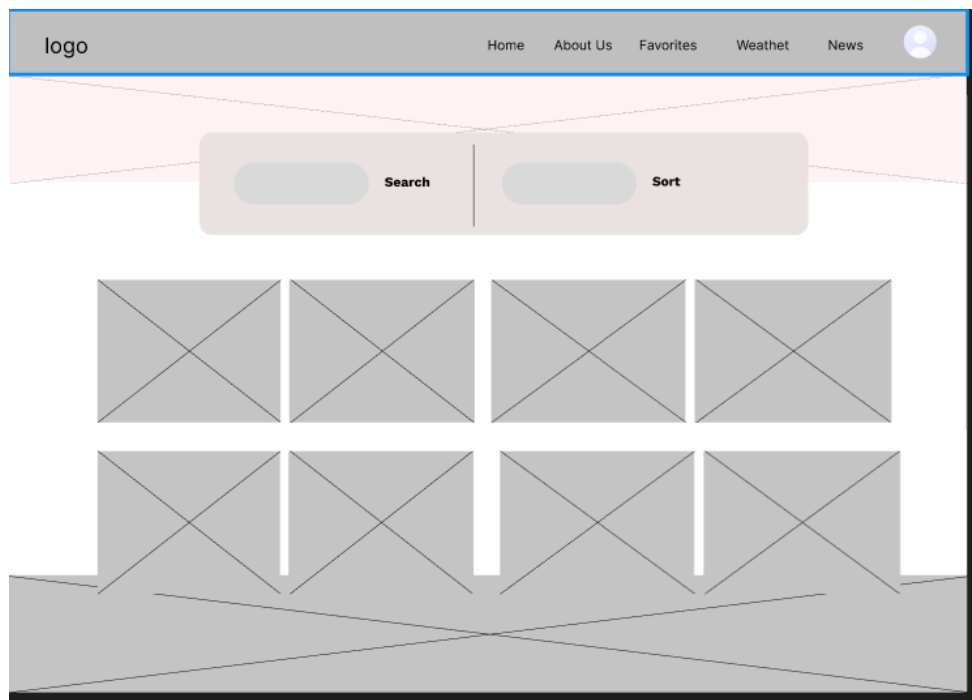

Figure 41: Login page

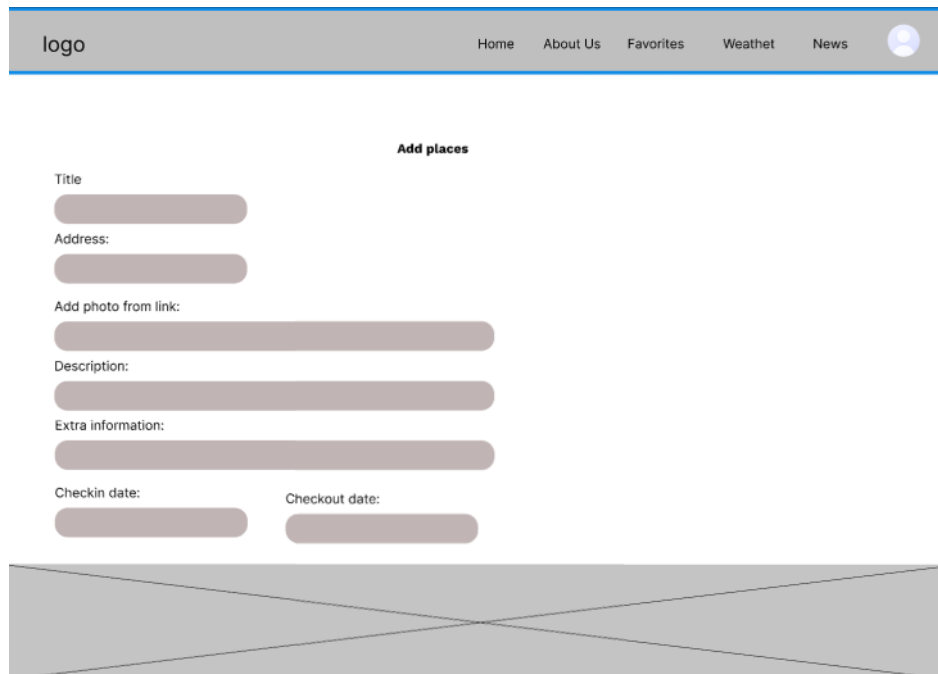

The image shows a web browser window with a 'Sign up' tab. The header bar contains a 'logo' on the left and navigation links 'Home', 'About Us', 'Favorites', 'Weathet', and 'News' on the right, along with a user profile icon. The main content area features a central 'Signup' form with the following fields: 'Full Name:', 'Phone number', 'Email:', and 'Password:'. Each field is represented by a white rounded rectangle. Below the 'Password:' field is a link that says 'Already have an account? Login'. The form is enclosed in a light gray box with a pink border. The bottom of the browser window shows a gray area with a large 'X' mark, indicating a placeholder for a footer or additional content.

Figure 42: Signup page

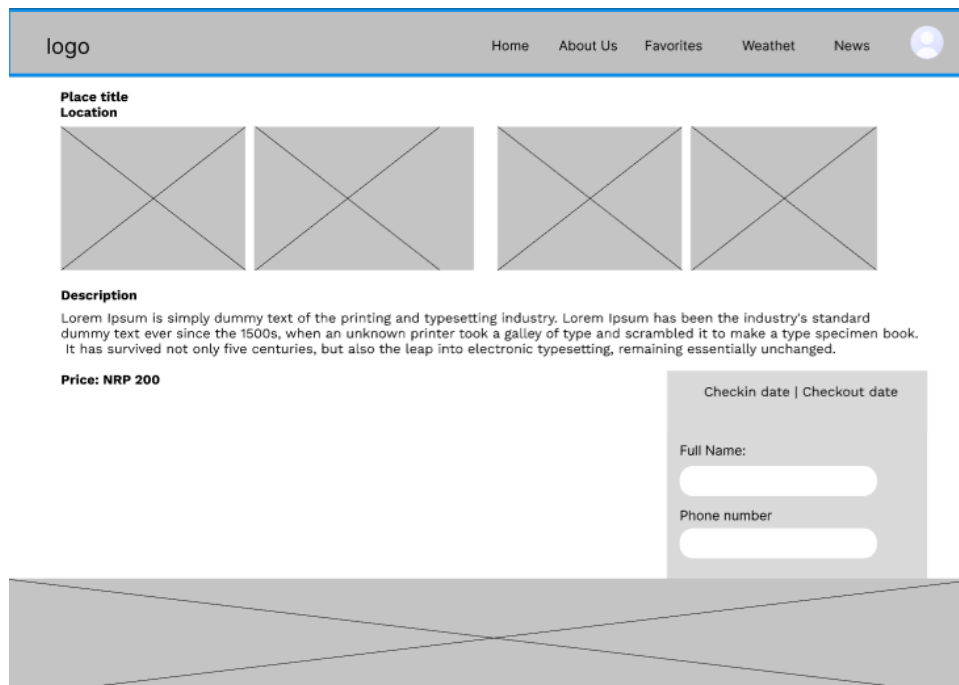

The image shows a web browser window with a 'logo' in the header and navigation links 'Home', 'About Us', 'Favorites', 'Weathet', and 'News'. Below the header is a light pink banner. Underneath the banner is a search bar with a 'Search' button and a 'Sort' button. The main content area consists of two rows of four gray placeholder boxes with 'X' marks, representing images or content blocks. The bottom of the browser window shows a gray area with a large 'X' mark, indicating a placeholder for a footer or additional content.

Figure 43: landing page

The 'Add places' page features a header with a 'logo' and navigation links: 'Home', 'About Us', 'Favorites', 'Weather', 'News', and a user profile icon. The main content area is titled 'Add places' and contains a form with the following fields: 'Title', 'Address', 'Add photo from link:', 'Description:', 'Extra information:', 'Checkin date:', and 'Checkout date:'. Each field is represented by a rounded rectangular input box. The bottom of the page is a large gray area with a diagonal cross, indicating a placeholder for an image or a full-page section.

Figure 44: Add place page

The 'Place information' page has a header identical to Figure 44. Below the header, the page is divided into two columns. The left column contains the following elements: 'Place title', 'Location', four square image placeholders (each with a diagonal cross), 'Description' (with a paragraph of Lorem Ipsum text), and 'Price: NRP 200'. The right column contains a 'Checkin date | Checkout date' label, a 'Full Name:' label with an input field, and a 'Phone number' label with an input field. The bottom of the page is a large gray area with a diagonal cross, similar to Figure 44.

Figure 60: payment confirmation from stripe

The image shows the 'Reset your password' page of the TravelMate application. It features a purple header with the TravelMate logo and navigation links: Home, About Us, Favorites, Weather, News, and a user profile icon. The main content area is white and contains a form with the title 'Reset your password'. The form has two input fields: 'New Password' and 'Confirm Password', each with a password strength indicator icon. Below the input fields is a purple button labeled 'Reset Password'.

Figure 61: Password reset page

The image shows the 'Weather Forecast' page of the TravelMate application. It features a purple header with the TravelMate logo and navigation links: Home, About Us, Favorites, Weather, News, and a user profile icon labeled 'Anirudha Dhungana'. The main content area is white and contains a form with the title 'Weather Forecast'. On the left, there is a section labeled 'Enter the location:' with a text input field containing 'kathmandu'. On the right, there is a weather forecast box for 'Kathmandu, NP'. The box displays a weather icon (clouds), the current temperature '31 °C', and a list of weather details: 'broken clouds', 'Feels Like: 30 °C', 'Humidity: 33 %', 'Wind Speed: 2 KM/H', and 'Pressure: 1014 hPa'.

About TravelMate

TravelMate, a web application merging "Travel" and "Mate," aims to be a friendly companion for travelers, streamlining various services under one platform. Its motto, "Explore the world with ease," reflects its commitment to simplicity, creativity, and personalized user experiences. The primary goals include seamless trip planning, secure booking, continuous innovation, and user-friendly design. Many travelers face challenges planning and executing trips smoothly, despite a growing demand for personalized experiences. TravelMate seeks to address these issues by offering a comprehensive solution integrating planning, security, sustainability, and detailed information.

The project introduces features like document uploads to eliminate the need for carrying physical documents, user-friendly interfaces, integrated booking services, and budget-friendly tour packages. Scopes include user registration, destination information, friendly interfaces accessible across devices, booking services integration, Weather Forecast and currency conversion. However, there are limitations, such as dependence on external data, device compatibility, sustainable data accuracy, resource constraints for continuous improvements, and limitations in user interface design.
